

The University of California at Davis Canine Genome Analysis Project is continuing to collect samples of Standard Poodles with ACTH diagnosed Addison's, as well as samples from healthy Standard Poodles over 7 years old. This project hopes to identify genetic factors associated with the risk of developing Addison's disease. Blood samples are preferred but buccal samples will be accepted. Instructions for submitting samples can be found at <http://cgap.ucdavis.edu/Addisons.htm>. The researchers also request that owners of dogs previously submitted to the study update their health status on a yearly basis at the following link: <http://cgap.ucdavis.edu/healthupdateform.htm>.
