

Sebaceous Adenitis

Sebaceous Adenitis is an autoimmune skin disorder in which the sebaceous glands become inflamed and are eventually completely destroyed resulting in hair loss or thinning, scales, and secondary skin infections.

Dr. Neils Pedersen, Center for Companion Animal Health, School of Veterinary Medicine UC Davis is seeking participants for his study entitled “Determining Whether Risk for Sebaceous Adenitis of Standard Poodles is Associated with a Specific DLA class II Genotype”. Dr. Pederson needs DNA samples from dogs with a confirmed diagnosis of SA as well as samples from their healthy relatives. For more information on this study and DNA sample submission forms see http://www.vetmed.ucdavis.edu/CAH/research/poodle_club.cfm or contact Dr. Pederson at ncpedersen@ucdavis.edu.
